

CLAIM AMENDMENTS

Please amend the claims as follows:

- 1 1. *(currently amended)* A compression-paddle mixer comprising:
 - 2 a compression paddle with one or more sets of two paddle blades on
 - 3 paddle spokes that are extended radially from a paddle rod;
 - 4 the paddle blades being juxtaposed colinearly to the paddle rod;
 - 5 the paddle rod having a direction of rotation that is transmitted from a
 - 6 predetermined power source;
 - 7 the one or more sets of the two paddle blades having circumferential
 - 8 travel in a direction of the circumferential travel that is transmitted through the
 - 9 paddle spokes by the rotation of the paddle rod;
 - 10 ~~the one or more sets of the two paddle blades having channel-funneled~~
 - 11 ~~orientations in the direction of the circumferential travel of the one or more sets of~~
 - 12 ~~the two paddle blades,~~
 - 13 the one or more sets of two paddle blades each having a radially outer
 - 14 paddle blade mounted on the paddle spokes parallel to the circumferential travel and
 - 15 a radially inner paddle blade which is mounted on the paddle spokes angularly to the
 - 16 outer paddle so that a distance between leading edges is greater than a distance
 - 17 between trailing edges of the paddle blades to form channel-funnel orientation in the
 - 18 direction of the circumferential travel;
 - 19 the channel-funneled orientations include channel-funnel inlets having
 - 20 funnel-inlet areas intermediate leading edges of the paddle blades of the one or more
 - 21 sets of the paddle blades in the direction of the circumferential travel of the one or
 - 22 more sets of the two paddle blades;

23 the channel-funneled orientations include channel-funnel outlets having
24 funnel-outlet areas intermediate trailing edges of the paddle blades of the one or
25 more sets of the two paddle blades; and
26 the funnel-inlet areas are predeterminedly larger than the funnel-outlet
27 areas.

1 2. (currently amended) The compression-paddle mixer of claim 1 wherein:
2 the channel-funneled orientations have compression ratios that are
3 defined by ratios of the ~~channel-funnel inlet areas to the channel-funnel outlet areas~~
4 distances between the leading edges to the trailing edges of the one or more sets of
5 the two paddle blades.

1 3. (currently amended) The compression-paddle mixer of claim 2 wherein:
2 means for increasing the compression ratios ~~are higher~~ predeterminedly
3 for mixes having high liquidity than for mixes having low liquidity, said means
4 comprising increasing the ratio of the distances between the leading edges to the
5 trailing edges of the one or more sets of the two paddle blades.

1 4. (currently amended) The compression-paddle mixer of claim 2 wherein:
2 means for increasing the rotation of the paddle rod has a speed of
3 rotation ~~that is higher~~ predeterminedly for the mixes having the high liquidity than
4 for the mixes having the low liquidity, said means comprising increasing the ratio
5 of the distances between the leading edges to the trailing edges of the one or more
6 sets of the two paddle blades.

1 **5.(original)** The compression-paddle mixer of claim **1** wherein:

2 the compression paddle has size, shape and structure articulated for
3 predetermined quantities of mix.

1 **6.(original)** The compression-paddle mixer of claim **5** wherein:

2 the predetermined quantities of mix include quantities ranging from one-
3 to-pluralities of barrels to one-to-pluralities of pints.

1 **7.(original)** The compression-paddle mixer of claim **1** and further comprising:

2 a mix container having a cylindrical interior periphery;

3 the cylindrical interior periphery having a predetermined quantitative
4 capacity of a plurality of select quantitative units;

5 the compression paddle having a paddle radius defined by a longest
6 extremity of the compression paddle from a center of the paddle rod;

7 the paddle radius being articulated to fit and to rotate predeterminedly
8 within the cylindrical interior of the mix container; and

9 the paddle blades having lengths that proximate a length of the
10 cylindrical interior periphery of the mix container.

1 **8.(original)** The compression-paddle mixer of claim **7** wherein:
2 the select quantitative units include quantitative units ranging from
3 barrels to pints.

1 **9.(original)** The compression-paddle mixer of claim **8** wherein:
2 the compression paddle and the mix container have structure articulated
3 for mixing predetermined consistencies of mix.

1 **10.(original)** The compression-paddle mixer of claim **9** wherein:
2 the predetermined consistencies of mix include particulate substances
3 having construction-item consistencies of gravel, sand, cement, mortar, clay,
4 alkalines and metallic particles selectively; and
5 the production-item consistencies of mix include liquids having
6 consistencies of water, liquidity modifiers, acid and petrochemicals selectively.

1 **11.(original)** The compression-paddle mixer of claim **9** wherein:
2 the predetermined consistencies of mix include non-production-item
3 consistencies of flour, sugar, food particles, dyes and seasoning selectively; and
4 the non-production-item consistencies of mix include water, liquid food
5 substances, honey, coloring, alcohol and preservatives selectively.

1 **12.(original)** The compression-paddle mixer of claim 1 wherein:

2 the compression paddle has a paddle radius defined by a longest
3 extremity of the compression paddle from a center of the paddle rod; and

4 the compression paddle fits rotatably in a mix container in which
5 radially outside extremities of the paddle blades rotate in sliding proximity to an
6 inside periphery of a cylindrical portion of the mix container.

1 **13.(original)** The compression-paddle mixer of claim 12 wherein:

2 the cylindrical portion of the mix container has a length that is
3 predeterminedly proximate a length of the paddle blades of the compression paddle.

1 **14.(original)** The compression-paddle mixer of claim 13 wherein:

2 the paddle blades of the compression paddle have lengths which are
3 predeterminedly longer than two radii of the compression paddle.

1 **15.(original)** The compression-paddle mixer of claim 1 wherein:

2 the paddle blades have blade edges and blade thicknesses structured for
3 ease of insertion into and removal from predetermined mix in the mix container.

1 **16.(original)** The compression-paddle mixer of claim 1 wherein:

2 the paddle rod has a rod-insertion end and rod thickness structured for
3 ease of insertion into and removal from the predetermined mix in the mix container.

1 **17. (original)** The compression-paddle mixer of claim 1 wherein:
2 the paddle spokes have thicknesses and structure articulated for ease of
3 insertion into and removal from the predetermined mix in the mix container.

1 **18. (original)** The compression-paddle mixer of claim 1 wherein:
2 the paddle blades have blade edges and blade thicknesses structured for
3 ease of insertion into and removal from predetermined mix in the mix container;
4 the paddle rod has a rod-insertion end and rod thickness structured for
5 ease of insertion into and removal from the predetermined mix in the mix container;
6 and
7 the paddle spokes have thicknesses and structure articulated for ease of
8 insertion into and removal from the predetermined mix in the mix container.

1 **19. (original)** The compression-paddle mixer of claim 1 wherein:
2 the paddle rod has a rod-power end with a power-source connection
3 articulated for rotation-transmissive connection to the predetermined power source.

1 **20. (original)** The compression-paddle mixer of claim 1 wherein:
2 the compression paddle has a paddle radius defined by a longest
3 extremity of the compression paddle from a center of the paddle rod;
4 the compression paddle fits rotatably in a mix container in which
5 radially outside extremities of the paddle blades rotate in sliding proximity to an
6 inside periphery of a cylindrical portion of the mix container;
7 the cylindrical portion of the mix container has a length that is
8 predeterminedly proximate a length of the paddle blades of the compression paddle;

9 the mix container includes a container bottom that is flat and orthogonal
10 to an axis of the paddle rod; and
11 the paddle blades have blade bottoms that travel circumferentially in
12 predetermined proximity to the container bottom.

1 **21. (original)** The compression-paddle mixer of claim **20** wherein:
2 the container bottom includes a valved opening.

1 **22. (original)** The compression-paddle mixer of claim 21 wherein:

2 the container bottom is positioned on a riser to raise the container

3 bottom predeterminedly above a container-support surface for allowing exit of the

4 mix from the mix container predeterminedly.

1 23. (currently amended) A compression-paddle mixer comprising:

2 a compression paddle having two sets of two paddle blades on paddle

3 spokes that are extended radially from a paddle rod;

4 the paddle blades being juxtaposed colinearly to the paddle rod;

5 the two sets of the two paddle blades are oppositely disposed radially

6 from the paddle rod;

7 the paddle rod having a direction of rotation that is transmitted from a

8 predetermined power source;

9 the two sets of the two paddle blades having circumferential travel in

10 a direction of the circumferential travel that is transmitted through the paddle spokes

11 by the rotation of the paddle rod;

12 ~~the two sets of the two paddle blades having channel-funnled~~

13 ~~orientations in the direction of the circumferential travel of the two sets of the two~~

14 ~~paddle blades;~~

15 the one or more sets of two paddle blades each having a radially outer
16 paddle blade mounted on the paddle spokes parallel to the circumferential travel and
17 a radially inner paddle blade which is mounted on the paddle spokes angularly to the
18 outer paddle so that a distance between leading edges is greater than a distance
19 between trailing edges of the paddle blades to form channel-funnel orientation in the
20 direction of the circumferential travel;

21 the channel-funneled orientations include channel-funnel inlets having
22 funnel-inlet areas intermediate leading edges of the paddle blades of the two sets of
23 the paddle blades in the direction of the circumferential travel thereof;

24 the channel-funneled orientations include channel-funnel outlets having
25 funnel-outlet areas intermediate trailing edges of the paddle blades of the two sets
26 of the two paddle blades;

27 the funnel-inlet areas are predeterminedly larger than the funnel-outlet
28 areas;

29 the channel-funneled orientations have compression ratios that are
30 defined by ratios of the channel-funnel inlet areas to the channel-funnel outlet areas
31 of the two sets of the two paddle blades;

32 the compression ratios are higher predeterminedly for mixes having
33 high liquidity than for mixes having low liquidity; and

34 the rotation of the paddle rod has a speed of rotation that is higher
35 predeterminedly for the mixes having the high liquidity than for the mixes having
36 the low liquidity.

1 **24. (original) The compression-paddle mixer of claim 23 wherein:**

2 the compression paddle has size, shape and structure articulated for
3 predetermined quantities of mix;

4 the predetermined quantities of mix include quantities ranging from
5 pluralities of barrels to pluralities of pints.

1 **25.(original)** The compression-paddle mixer of claim 23 and further
2 comprising:

3 a mix container having a cylindrical interior periphery;

4 the cylindrical interior periphery having a predetermined quantitative
5 capacity of a plurality of select quantitative units;

6 the compression paddle having a paddle radius defined by a longest
7 extremity of the compression paddle from a center of the paddle rod;

8 the paddle radius being articulated to fit and to rotate predeterminedly
9 within the cylindrical interior of the mix container;

10 the paddle blades having lengths that proximate a length of the
11 cylindrical interior periphery of the mix container;

12 the select quantitative units include quantitative units ranging from
13 barrels to pints; and

14 the compression paddle and the mix container have structure articulated
15 for predetermined consistencies of mix.

1 **26.(original)** The compression-paddle mixer of claim 25 wherein:

2 the predetermined consistencies of mix include gravel, sand, cement,
3 mortar, clay, alkalines, and metallic particles selectively; and

4 the predetermined consistencies of mix include water, acid and
5 petrochemicals selectively.

1 **27.(original)** The compression-paddle mixer of claim **25** wherein:

2 the predetermined consistencies of mix include flour, sugar, food

3 particles and seasoning selectively; and

4 the predetermined consistencies of mix include water, liquid food

5 substances, honey, coloring, alcohol and preservatives selectively.

1 **28.(original)** The compression-paddle mixer of claim **23** wherein:

2 the compression paddle has a paddle radius defined by a longest

3 extremity of the compression paddle from a center of the paddle rod; and

4 the compression paddle fits rotatably in a mix container in which

5 radially outside extremities of the paddle blades rotate in sliding proximity to an

6 inside periphery of a cylindrical portion of the mix container;

7 the cylindrical portion of the mix container has a length that is

8 predeterminedly proximate a length of the paddle blades of the compression paddle;

9 and

10 the paddle blades of the compression paddle have lengths which are

11 predeterminedly longer than two radii of the compression paddle.

1 **29.(original)** The compression-paddle mixer of claim **23** wherein:

2 the paddle blades have blade edges and blade thicknesses structured for

3 ease of insertion into and removal from predetermined mix in the mix container;

4 the paddle rod has a rod-insertion end and rod thickness structured for

5 ease of insertion into and removal from the predetermined mix in the mix container;

6 the paddle spokes have thicknesses and structure articulated for ease of

7 insertion into and removal from the predetermined mix in the mix container.; and

8 the paddle rod has a rod-power end with a power-source connection
9 articulated for rotation-transmissive connection to the predetermined power source.

1 30. (currently amended) A compression-paddle mixer comprising:

2 a compression paddle having two sets of two paddle blades on paddle

3 spokes that are extended radially from a paddle rod;

4 the paddle blades being juxtaposed colinearly to the paddle rod;

5 the two sets of the two paddle blades are oppositely disposed radially

6 from the paddle rod;

7 the paddle rod having a direction of rotation that is transmitted from a

8 predetermined power source;

9 the two sets of the two paddle blades having circumferential travel in

10 a direction of the circumferential travel that is transmitted through the paddle spokes

11 by the rotation of the paddle rod;

12 ~~the two sets of the two paddle blades having channel-funneled~~

13 ~~orientations in the direction of the circumferential travel of the two sets of the two~~

14 ~~paddle blades;~~

15 the one or more sets of two paddle blades each having a radially outer

16 paddle blade mounted on the paddle spokes parallel to the circumferential travel and

17 a radially inner paddle blade which is mounted on the paddle spokes angularly to the

18 outer paddle so that a distance between leading edges is greater than a distance

19 between trailing edges of the paddle blades to form channel-funnel orientation in the

20 direction of the circumferential travel;

21 the channel-funneled orientations include channel-funnel inlets having
22 funnel-inlet areas intermediate leading edges of the paddle blades of the two sets of
23 the paddle blades in the direction of the circumferential travel thereof;

24 the channel-funneled orientations include channel-funnel outlets having
25 funnel-outlet areas intermediate trailing edges of the paddle blades of the two sets
26 of the two paddle blades;

27 the funnel-inlet areas are predeterminedly larger than the funnel-outlet
28 areas; and

29 the channel-funneled orientations have compression ratios that are
30 defined by ratios of the channel-funnel inlet areas to the channel-funnel outlet areas
31 of the two sets of the two paddle blades.

1 31. (original) The compression-paddle mixer of claim 30 wherein:

2 the compression paddle has a paddle radius defined by a longest
3 extremity of the compression paddle from a center of the paddle rod;

4 the compression paddle fits rotatably in a mix container in which
5 radially outside extremities of the paddle blades rotate in sliding proximity to an
6 inside periphery of a cylindrical portion of the mix container;

7 the cylindrical portion of the mix container has a length that is
8 predeterminedly proximate a length of the paddle blades of the compression paddle;

9 the mix container includes a container bottom that is flat and orthogonal
10 to an axis of the paddle rod; and

11 the paddle blades have blade bottoms that travel circumferentially in
12 predetermined proximity to the container bottom.

1 **32. (original)** The compression-paddle mixer of claim 31 wherein:

2 the container bottom includes a valved opening; and

3 the container bottom has a bottom exterior that is raised

4 predeterminedly above a container-support surface for allowing exit of the mix from

5 the mix container predeterminedly.
